Background

(Siemens single-plane C-arm) (C-arm imaging geometry) (ICA images)

- X-ray invasive coronary angiography (**ICA**) acquires 2D projections of coronary artery tree (based on C-arm) and is the gold standard during cardiac interventions

Motivation & Challenges

3D reconstruction of coronary artery tree from **two 2D ICA** projections helps:

- Reduce the likelihood of subjective 3D geometry interpretation
- Reduce extra contrast injected and extra X-ray radiation dose exposed
- Using **deep learning** helps:
  - Automated 3D reconstruction in real time
  - **Implicitly compensate** for the non-rigid cardiac and respiratory motions

This task is hard because:

- **Non-rigid** motion by **non-simultaneous acquisition**, causing vessels to misalign between projections
- Only **two** projections acquired
- **No corresponding 3D ground truth**
- **No prior work** to tackle the non-simultaneous ICA projections using deep learning

Method

Our encoder-decoder architecture is based on the Wasserstein conditional generative adversarial network (**WCGAN**) with gradient penalty (**WGP**), latent convolutional transformer layers (**CTLs**), and a dynamic snake convolutional critic (**DSCC**)

- Via mapping the input with non-aligned projections to 3D coronary tree data, **most motion artifacts are corrected** by our model
- With the critic used, **any residual deformations are adjusted**, while ensuring the connectedness of coronary artery tree structures and increasing the model's elastic generalisation capacity
- So when generalising to **clinical non-simultaneous** ICA projections for **3D coronary artery tree reconstruction**, the **non-rigid** motion is **compensated implicitly**

Evaluation Method

Datasets:

- Use a **public** Coronary Computed Tomography Angiography (**CCTA**) dataset (ImageCAS) for training
- Collect a **clinical ICA dataset** from the John Radcliffe Hospital for evaluation

Metrics:

- Overlap using a sweeping distance threshold Ot(t_0) (%) **&** Chamfer distance (CD($\ell 2$)) (mm)

Results

Model	3D CCTA Test Dataset			2D Real Clinical ICA Dataset (Unseen Domain)						
				1st	2nd Projection			Additional Projection		
	$Ot(1)\uparrow$	$Ot(2)\uparrow$	$CD(\ell_2)\downarrow$	Dice ↑	$Ot(1)\uparrow$	$Ot(2)\uparrow$	$CD(\ell_2)\downarrow$	$Ot(1)\uparrow$	$Ot(2)\uparrow$	$CD(\ell_2)\downarrow$
U-Net++	51.99 (±12.17)	64.75 (±13.28)	4.64 (±2.01)	65.42 (±6.68)	22.97 (±10.82)	31.05 (±12.76)	12.79 (±4.61)	25.25 (±18.40)	39.37 (±20.75)	8.49 (±3.26)
